Agentic process and limitations

Planner -> RETRIEVE -> CALCULATE -> REPORT -> FINISH. Each action updates agent state, then the planner chooses the next node. The bounded loop terminates when the report is complete.

All reported numbers are obtained from supplied 10-K financial tables; calculations use Python Decimal. LSA semantic retrieval supplements (but does not replace) exact structured retrieval. All dollars are USD; figures in tables are USD millions. Fiscal 2025 is the latest in the assigned dataset.
